SHELDON MARSH SECTION 227

Project Goals

- **Slow the retreat of the barrier and protect the interior wetlands**
- **Allow wave energy to periodically overtop existing dunes**
- **Allow wave energy to wet the beach slope during wave activity**
- **Minimize visual impact over a wide range of water levels**
- **Provide additional fish habitat**
- **Minimize future maintenance.**

Physical Model Tests

- Actual lake bottom slope
- Refined spacing of breakwaters
- Water Levels Modeled
 - 10-yr
 - Average
 - Low (no tests run)
- Wave Heights Modeled
 - 20-yr
 - 2-yr
 - Average

of Engineers
Buffalo District

SHELDON MARSH SECTION 227

Construction of Submerged Breakwater Segments

- 2 ft thick bedding layer that extends beyond armor layer to act as an erosion apron
- Single layer of dimensioned rubblemound armor stone. Stone size – 4 ft x 4 ft x 3 ft (+/-)
- Reefballs interlocked within the breakwater matrix.

US Army Corps
of Engineers
Buffalo District

SHELDON MARSH SECTION 227

Fish Habitat

➤ Fish habitat will be provided by incorporating the Reefball System within each of the submerged breakwater segments.

SHELDON MARSH SECTION 227

SHELDON MARSH MODEL STUDY AVERAGE WAVE HEIGHT AT GAUGES 8-10				
WATER LEVEL	WAVE RECURRENCE INTERVAL	AVERAGE WAVE HEIGHT - FT		PERCENT REDUCTION
		EXISTING	WITH PROJECT	
AVERAGE	AVERAGE	2.119	1.176	45
	2-YEAR	2.364	1.567	34
	20-YEAR	2.803	1.513	46
10-YEAR	AVERAGE	3.067	2.376	23
	2-YEAR	4.484	3.918	13
	20-YEAR	4.638	3.861	17

US Army Corps
of Engineers
Buffalo District

SHELDON MARSH SECTION 227

Conclusions

- **Measured project wave reduction with model was 13-46%. (Actual wave dissipation should be higher than model.)**
- **Wave energy will periodically overtop existing dunes**
- **Wave energy will continue to wet the beach slope**
- **Visual impact will be minimized during a wide range of water levels**
- **Additional fish habitat will be provided**
- **Maintenance will be minimized.**
